

About ADMi

- Advanced Data Mining International, LLC
 - Greenville, SC; founded 2002
 - Clients Alcoa, BP, B&V, state agencies, water utilities, USACOE, USGS, USDOE, WERF, WRF......

Focus

- Problem solving through data mining
- Solutions deployed with Decision Support Systems (DSS)

Expertise

- Industrial polymers, metals, oil & gas
- Water treatment optimization, DBPs, event detection systems (EDS)
- Natural Systems surface & ground water modeling for resource management, TMDLs
 - Projects in FL, GA, OR, SC, WI

Estimating Salinity Effects Due to Climate Change on the Georgia and South Carolina Coasts

Water Research Foundation (WRF) Project 4285

Beaufort-Jasper Water and Sewer Authority (BJWSA)

ADMi

U.S. Geological Survey (USGS)

University of South Carolina (USC)

South Carolina Sea Grant Consortium (Sea Grant)

- Published Sept. 2012
- Shortened version of full USGS report to come
- Written for utility personnel
- Even shorter white paper is available

Tailored Collaboration

Estimating Salinity Effects Due to Climate Change on the Georgia and South Carolina Coasts

Web Report #4285

Utilities with intakes at risk from climate change & sea-level rise (SLR)

Source: modified from Furlow et al. 2002

Project goal and thesis

- Goal develop <u>practical method</u> for utilities to assess vulnerability to climate change and SLR
- Thesis
 - Because of past storms and droughts, longterm <u>historical data already contains the</u> <u>information</u> about how a hydrologic system will respond
 - Accurate models for the full range of historical forcing can be used to <u>asses risk</u>.

Droughts, El Niño, intrusion events (Savannah River Estuary)

Technical Approach

Integrate 3 models

Decision support systems (DSS)

2 example estuaries

- Pee Dee Basin
 - Intake on Waccamaw River
 - Preexisting model PRISM (2007) for FERC relicensing of dams
 - This project GCM + watershed model + estuary model DSS
- Lower Savannah River
 - Intakes on Albercorn Creek and Savannah River
 - Preexisting model M2M (2006) for Savannah Harbor deepening
 - This project used only estuary model DSS

Pee Dee Basin

- PRISM DSS (Pee Dee River and Atlantic Intracoastal Waterway Salinity Intrusion Model)
- FERC relicensing of NC dams
- Calibrated 1995-2009
 - added new data for this project

M2M DSS (Model to Marsh)

- Modeled impacts of harbor deepening on SNWR
- Connects EFDC to UFL's "Plant Succession Model"
- Calibrated 1994-2005

Lower Savannah River

02198980 USGS gaging station and number

Roles of participants

- WRF & BJWSA sponsors
- USGS originated idea, tech team coordination, climate change modeling
- USC* downscaling model to Pee Dee River basin, outreach workshops with DSSs to Grand Strand and Savannah stakeholders
- ADMi⁺ developed estuary models and DSSs
- SC Sea Grant* outreach workshops
 - * funded by NOAA
 - + co-funded by WRF & NOAA

About ANN Modeling

Process modeling with artificial neural networks (ANN)

- Multivariate curve fitting
- Fits are "learned", not prescribed like least-squares
- Used in continuous process industries

M2M – salinity intrusion

Model Calibration

Evaluated 4 GCMs (with calibrated HSPF)

GCM selection

HSPF Calibration

PRISM inputs

HSPF Calibration

cont. - HSPF Calibration

PRISM Calibration

PRISM Calibration (near intake)

M2M inputs

▲02198980 USGS gaging station and number

M2M Calibration

Lower Savannah - EFDC vs. M2M

Conrads, P., and Greenfield, J., (2008), "Effects of Reduced Controlled Releases from Lake Thurmond on Salinity Intrusion in the Lower Savannah River Estuary", 2008 South Carolina Water Resources Conferences.

Pee Dee Basin Results

Pee Dee - 3 prediction scenarios

- $\Delta Q = 0\%$ = historical flow
 - 1.0 ft SLR increases event magnitude and duration
- Future = 1995-2005 study period +60 = 2055-2069
 - ECHO-G with IPCC "business as usual " A2 emissions scenario
 - Intergovernmental Panel on Climate Change
 - Future is wetter, more events of shorter duration

Modulate historical Q and SL

3.0				23	20	19	15	13	11							

Predicted wetter future has fewer %days > x

Lower Savannah Results

Savannah - 3 prediction scenarios

- No future scenario for Savannah
- 3rd scenario obscures other 2 see detail

Detail – 3 Savannah scenarios

- 3rd (worst) scenario really is worst!
- Some spikes ∆Q+SLR effect >> SLR alone
 - unlike Pee Dee

%days > x μS/cm

Conclusions

Conclusions

- The Method
 - 1. Site-specific estuary model needed to credibly assess vulnerability
 - empirical model may be
 - more accurate
 - easier to develop, operate, and update with new data
 - faster turn-around for "What ifs?"
 - 2. Long-term, site-specific data needed to calibrate model
 - past behaviors likely span much of future range
 - droughts, hurricanes / storms, El Nino
 - If in hand, ready to model. If not, start collecting.
 - 3. Run scenarios ⇒ easy-to-understand tables & graphs
 - modify historical data
 - future forecasts, e.g., GCM+carbon emissions scenarios
- Method applicable to other resources, e.g., groundwater.
