Tarana Solaiman, SFWMD

Jayantha Obeysekera, FIU

John F. Stamm, USGS

Brett Johnston, USGS

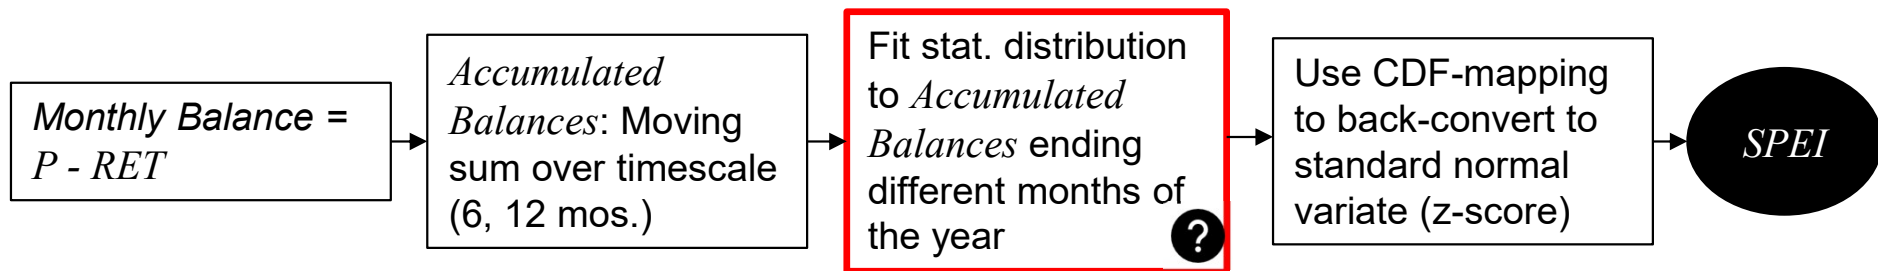

## Objectives and Scope

- Collaborative project between USGS, SFWMD, and FIU
- Evaluate projections of future drought event characteristics from climate models
- Will inform water-supply planning vulnerability assessments at SFWMD to determine the capacity of local and regional water resources to meet future water needs.
- Ultimate Need:
  - Identify a small subset of climate models representing a plausible range of future drought conditions to drive hydrologic and groundwater models used in water-supply planning for 2075.

# Characterizing Historical Droughts

- SPI and SPEI estimated from 2x2 mi SFWMD gridded  $P$  and  $RET$  from historical observations and reanalysis data (1948–2022)

$P$ : monthly precipitation

$RET$ : monthly reference evapotranspiration

$SPEI$ : Standardized Precipitation Evapotranspiration Index

$SPI$ : Standardized Precipitation Index (same steps as for SPEI but using just Precipitation instead of Balances)

# Characterizing Historical Droughts

- SPI and SPEI estimated from 2x2 mi SFWMD gridded  $P$  and  $RET$  from historical observations and reanalysis data (1948–2022)

Table I. SPI categories

SPI	Category
2.00 and above	Extremely wet
1.50 to 1.99	Very wet
1.00 to 1.49	Moderately wet
−0.99 to 0.99	Near normal
−1.00 to −1.49	Moderately dry
−1.50 to −1.99	Severely dry
−2.00 and less	Extremely dry

McKee et al. (1993)

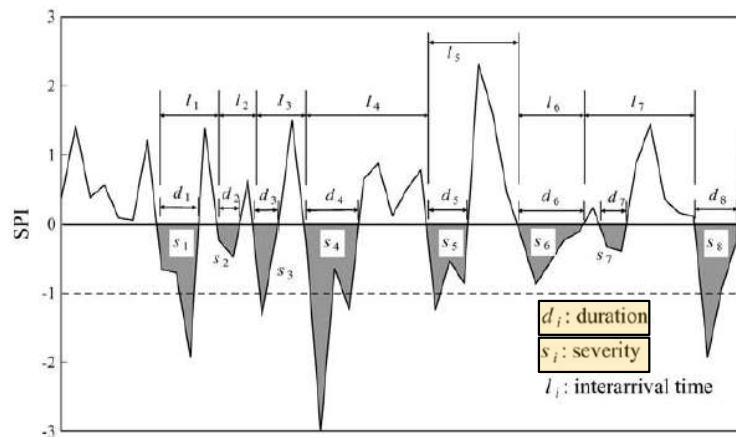

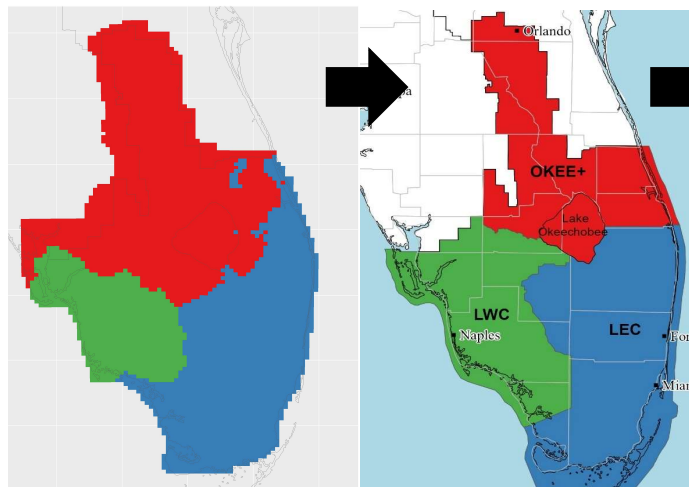

Figure 1. Definition sketch of drought events.

$i_i$ : intensity  
 $= \text{severity} / \text{duration}$

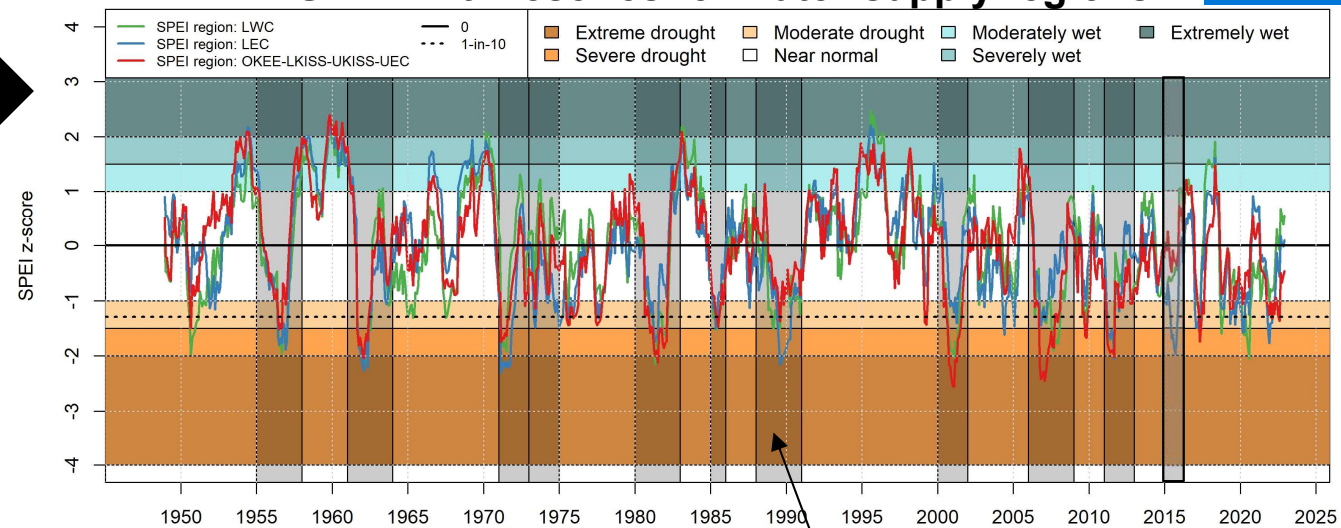

Shiau (2006)

# SPI and SPEI Regionalization via PCA

LWC: Lower West Coast, LEC: Lower East Coast,  
OKEE+: Lower & Upper Kissimmee, Upper East Coast, plus Lake Okeechobee

## SPEI-12 timeseries for water-supply regions

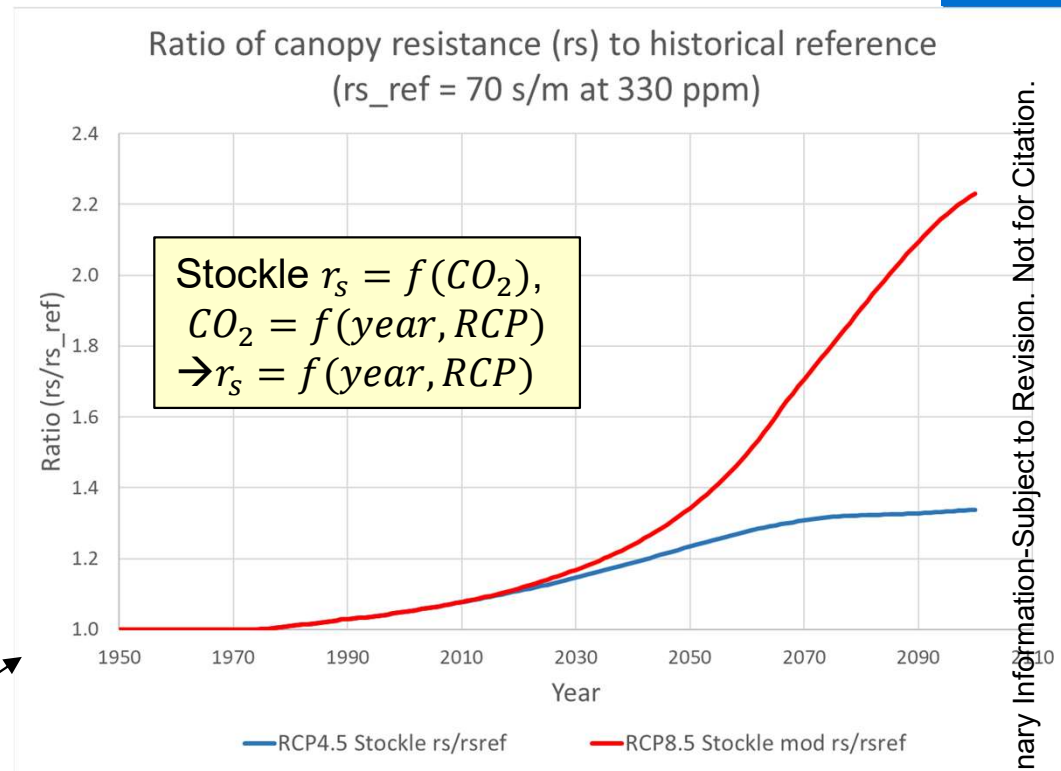

Historical droughts  
of significance

Region	SPEI Timescale (months)	Months of the year	Sen-Theil Trend (SPEI index value/mo. per yr.)
LWC	1	Aug.	+0.0102*
LWC	1	Oct.	-0.0122*
LEC	1	Oct.	-0.0147*
OKEE+	1	Oct.	-0.0127
OKEE+	12	Jan.-Dec.	-0.0114

\*similar trends found for SPI

# Future Drought Projections

- MACA (CMIP5) Statistically Downscaled Climate Dataset. 20 GCMs, 2 bias-correction datasets, 2 scenarios: RCP4.5 and RCP8.5.
  - Monthly  $P$  and meteorological data for  $RET$  estimation.  $RET$  bias-corrected to USGS  $RET$  for 1995–2005.
  - Due to global warming,  $RET$  will increase into the future. May be mitigated at least partially by potential increases in plant **stomatal resistance ( $r_s$ )** due to increased  $CO_2$  concentrations. **What  $r_s$  to assume into the future?**

## Challenges with SPEI Projections

- Distributions fit to 6- and 12-mo. *Accumulated balances* ( $P - RET$ ) in the historical reference period 1950–2005 only (12 fits, one per month). Then we **also** use those historically fitted probability distributions to determine future SPEI values for 2006–2100, i.e., future SPEI is *with respect to the historical reference period*.
- Problems when distributions are fit to *Accumulated balances* in the “worst-case” scenario assuming that the current stomatal resistance holds into the future (GW increases *RET* unimpeded):
  - Distributions that best capture lower tail tend to result in **many +/- infinity SPEI values in the future for some models**. Major non-stationarity into the future.
- What do we do then?

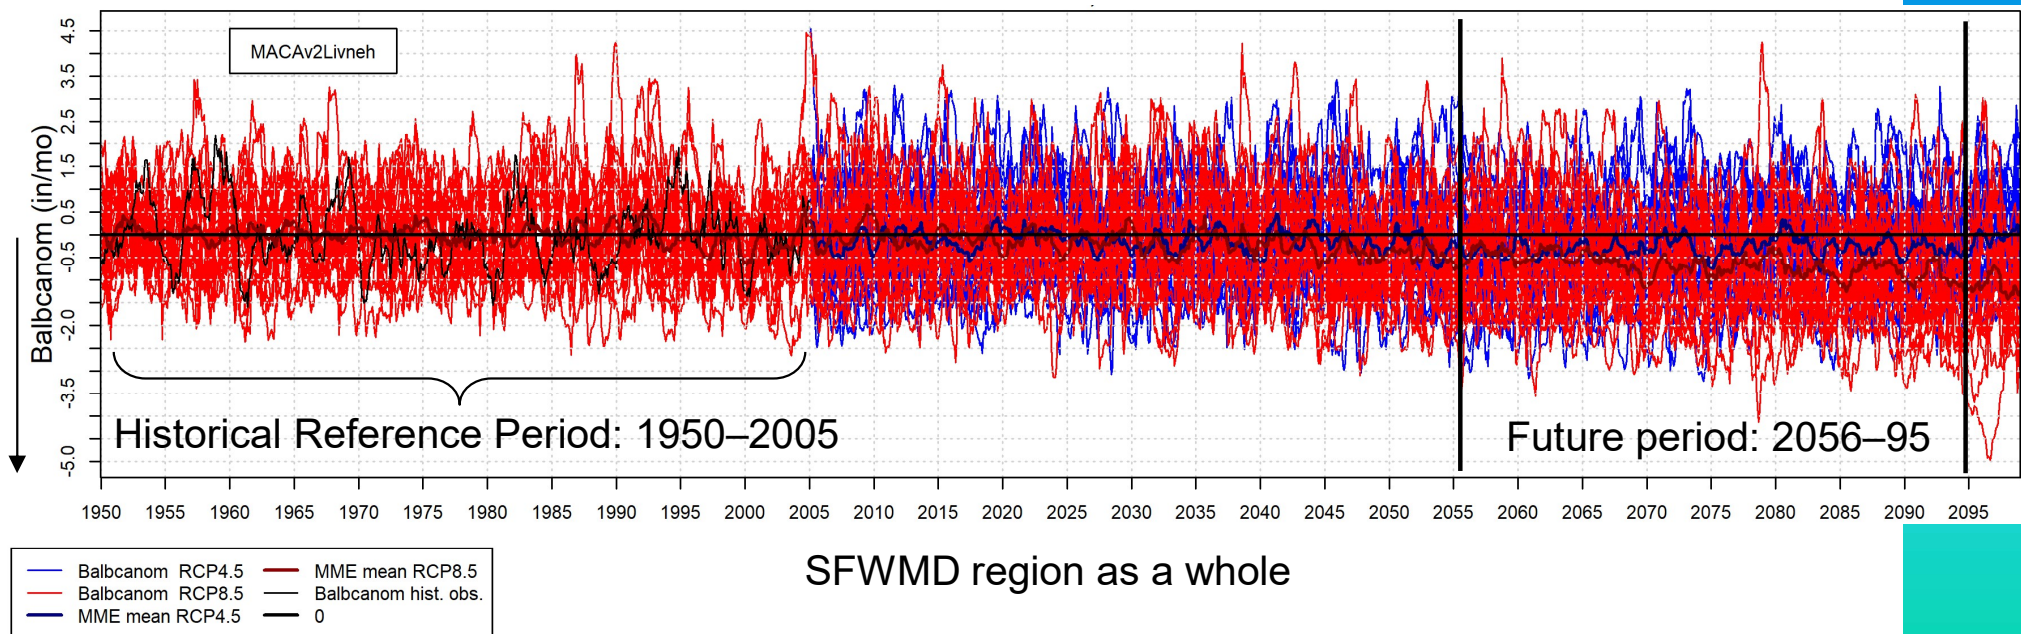

# Alternative: Timescale-Averaged Balance Anomalies

Monthly Balance =  
 $P - RET$

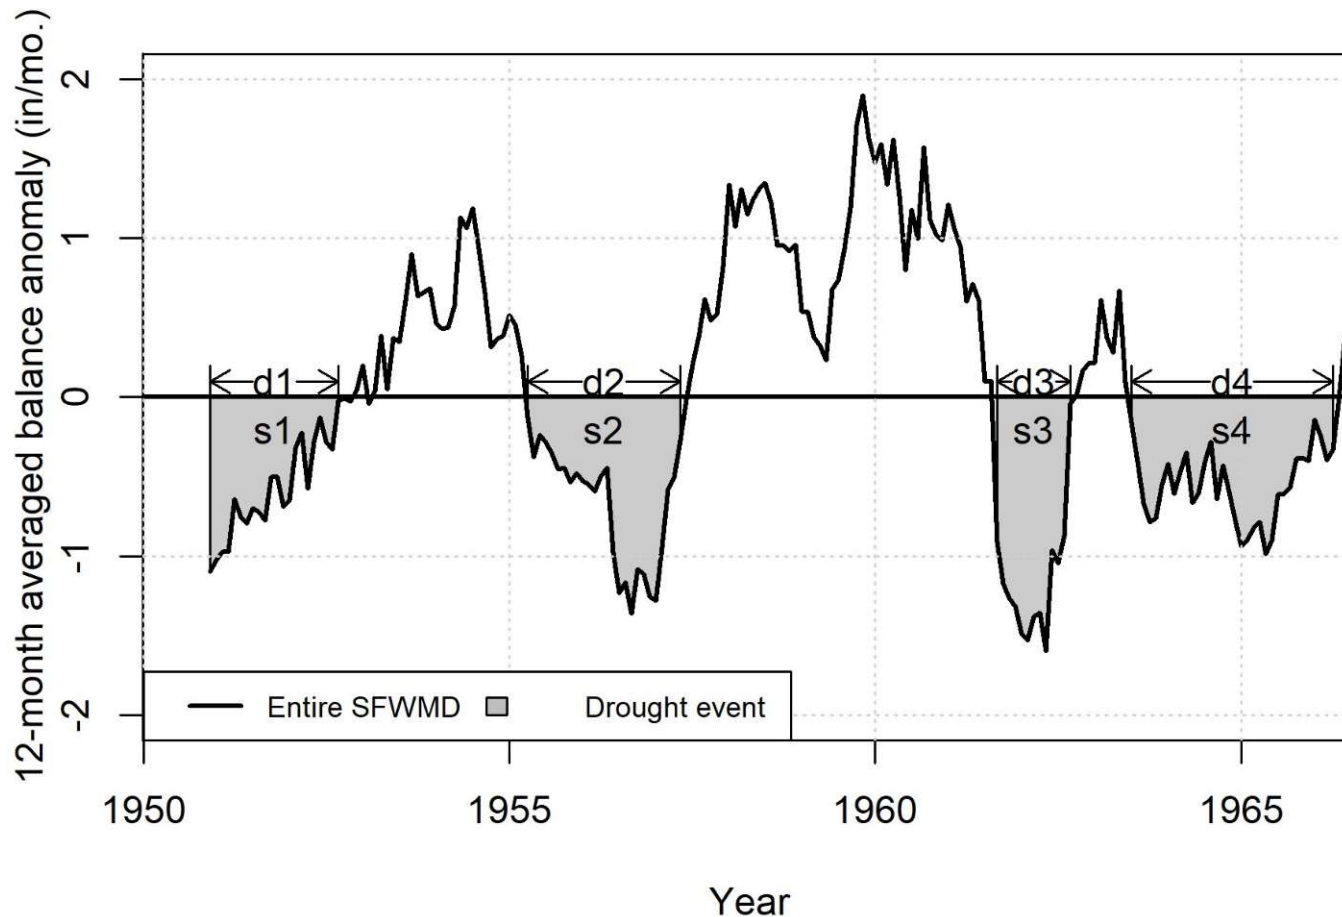

Subtract mean  
historical *balance*  
for month of the  
year to get *Balance*  
*Anomalies*

Moving average of  
*Balance Anomalies*  
over timescale (6,  
12 mos.)

*Timescale-*  
*Averaged Balance*  
*Anomaly*

# Drought-Event Characterization

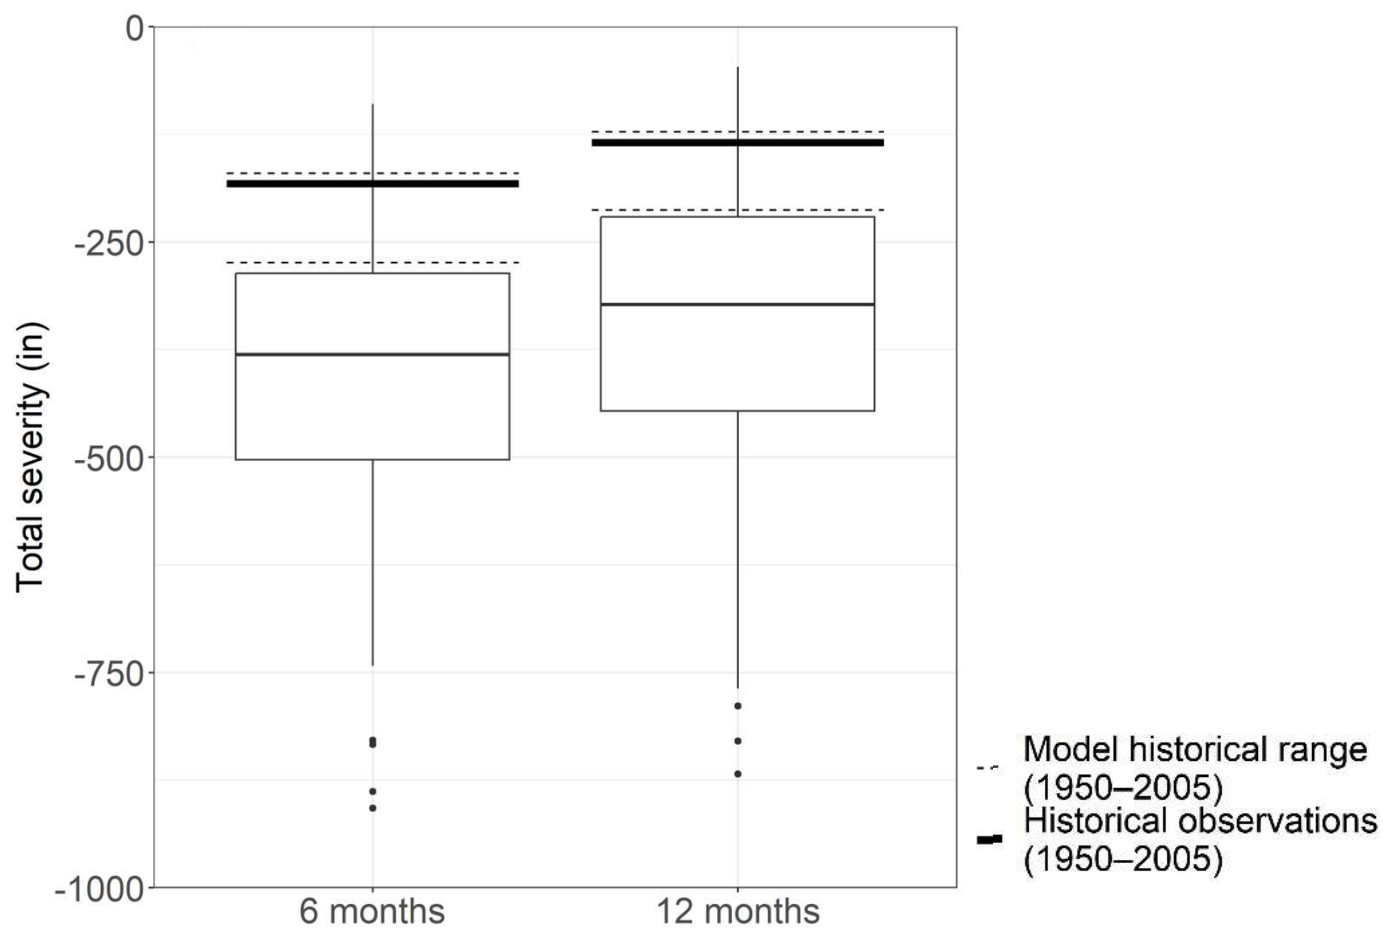

$s_k$ : severity for event  $k$   
 $d_k$ : duration for event  $k$   
 $i_k$ : intensity for event  $k$

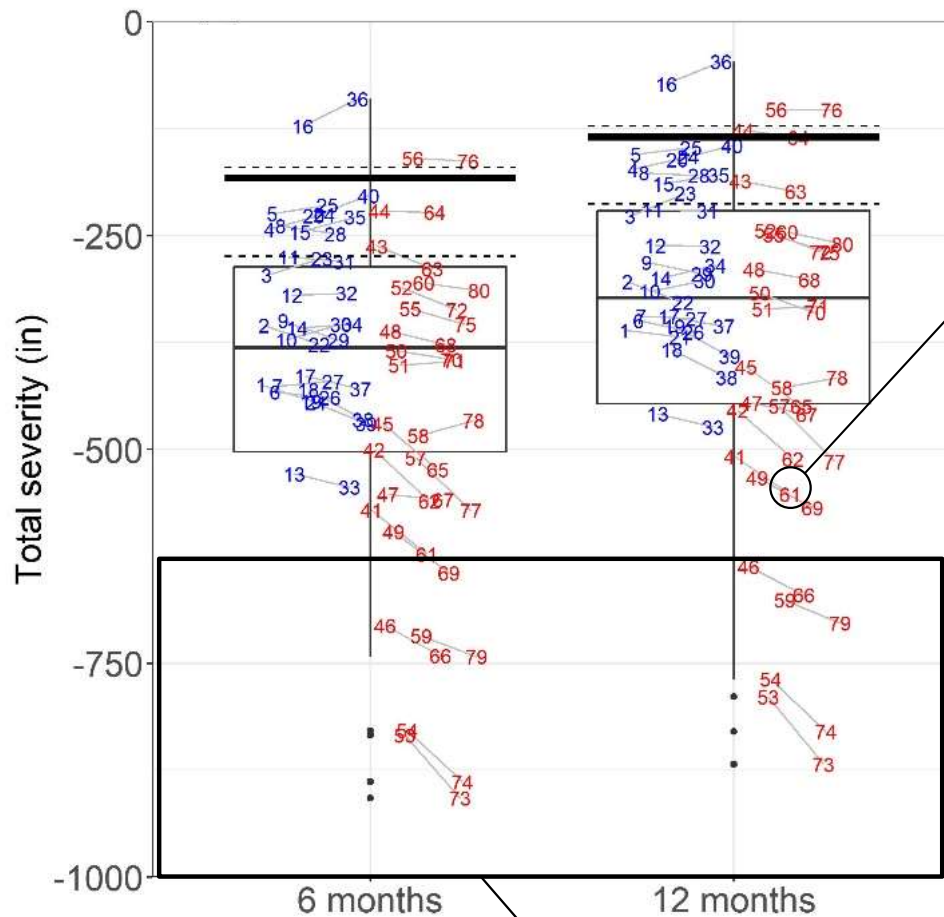

$$i_k = s_k / d_k$$

Convention for droughts:  
 $s_k < 0$  and  $i_k < 0$

### Total severity (in) over period 2056–95

### Total severity (in) over period 2056–95

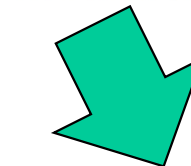

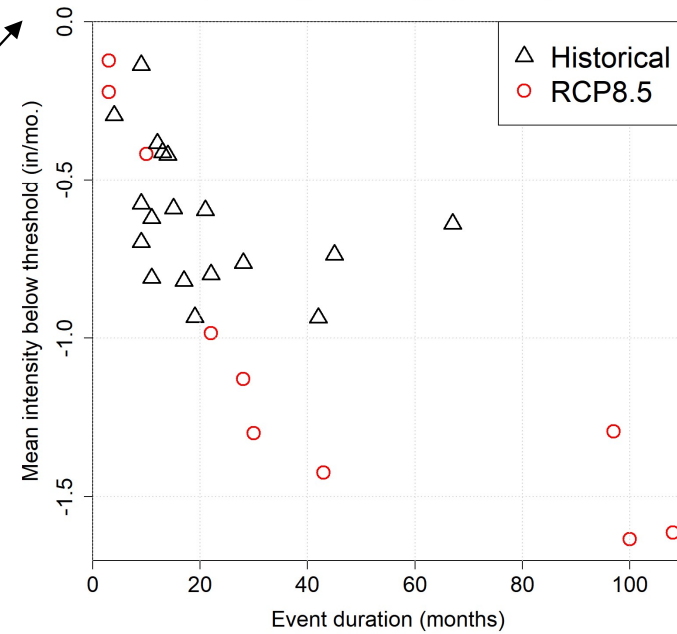

RCP4.5  
RCP8.5

- RCP4.5
- RCP8.5
- Model historical range (1950–2005)
- Historical observations (1950–2005)

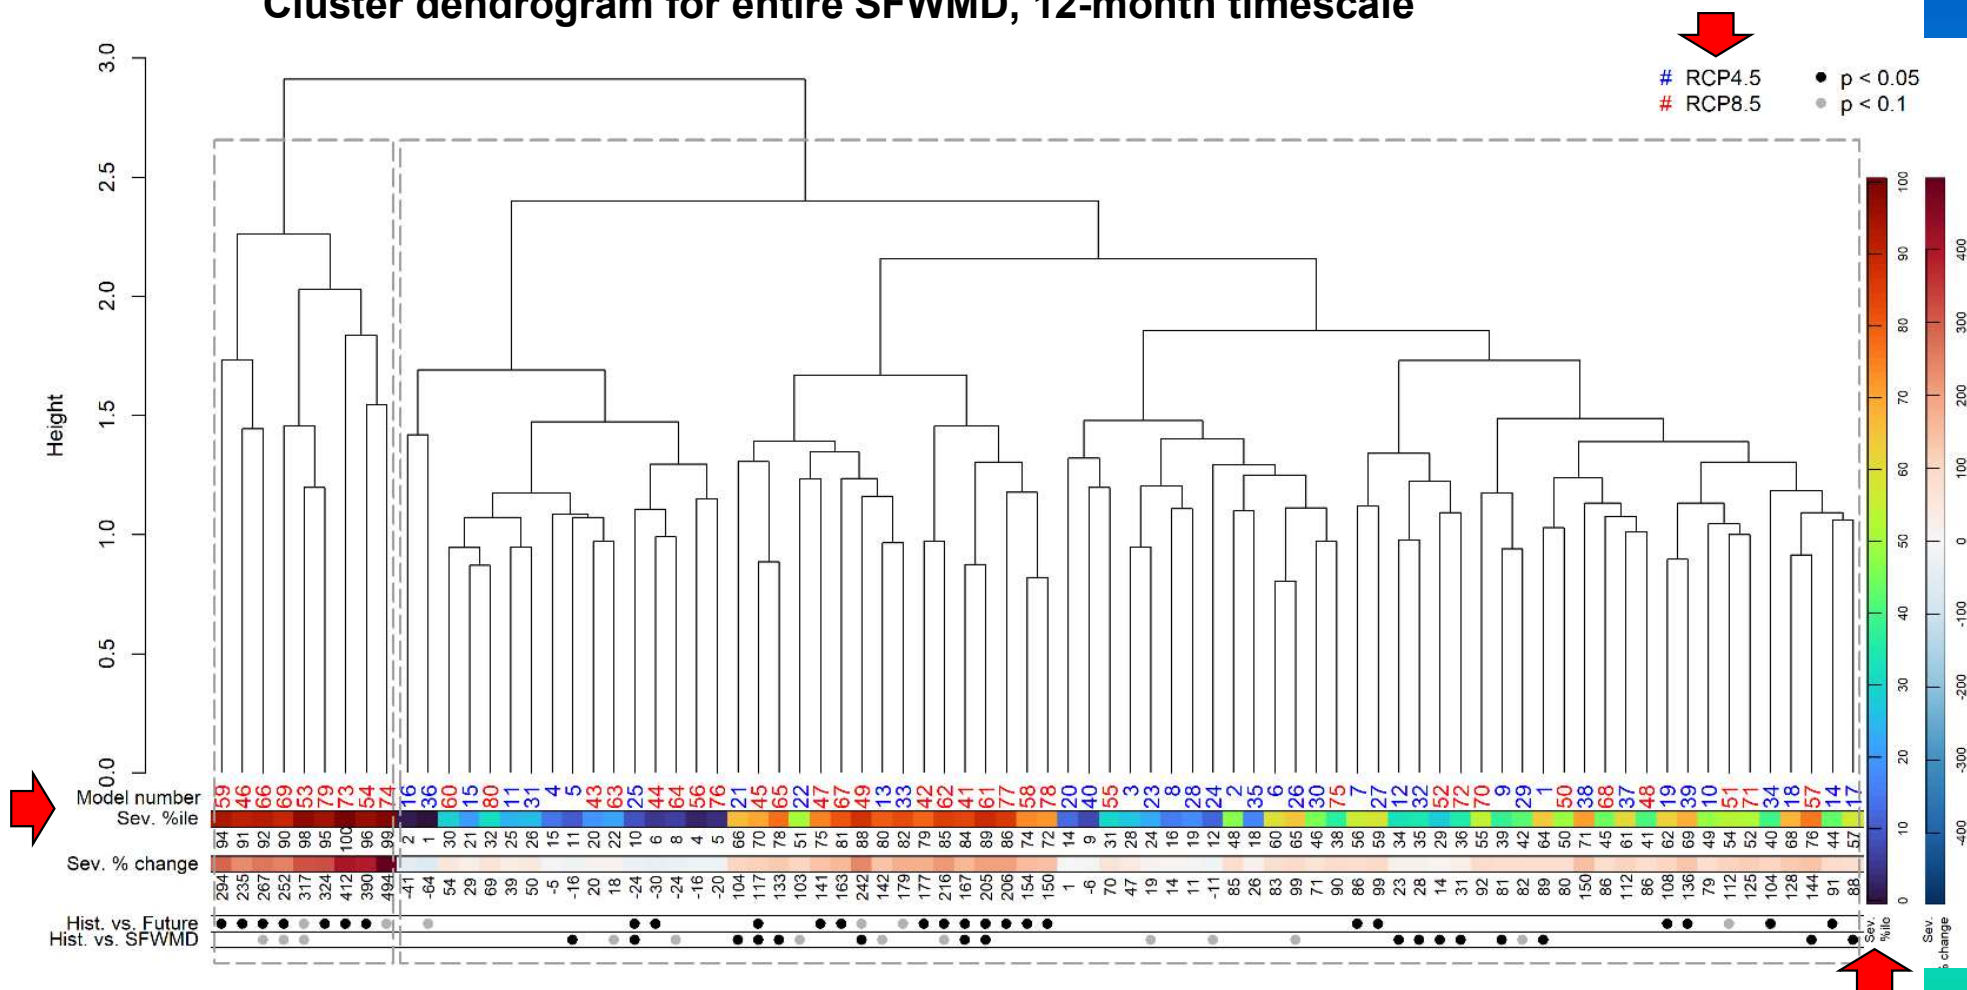

RCP8.5 Models 46, 66, 53, 73, 54, 74, 59, 79 are outliers.

### RCP8.5 macav2metdata\_BNU-ESM

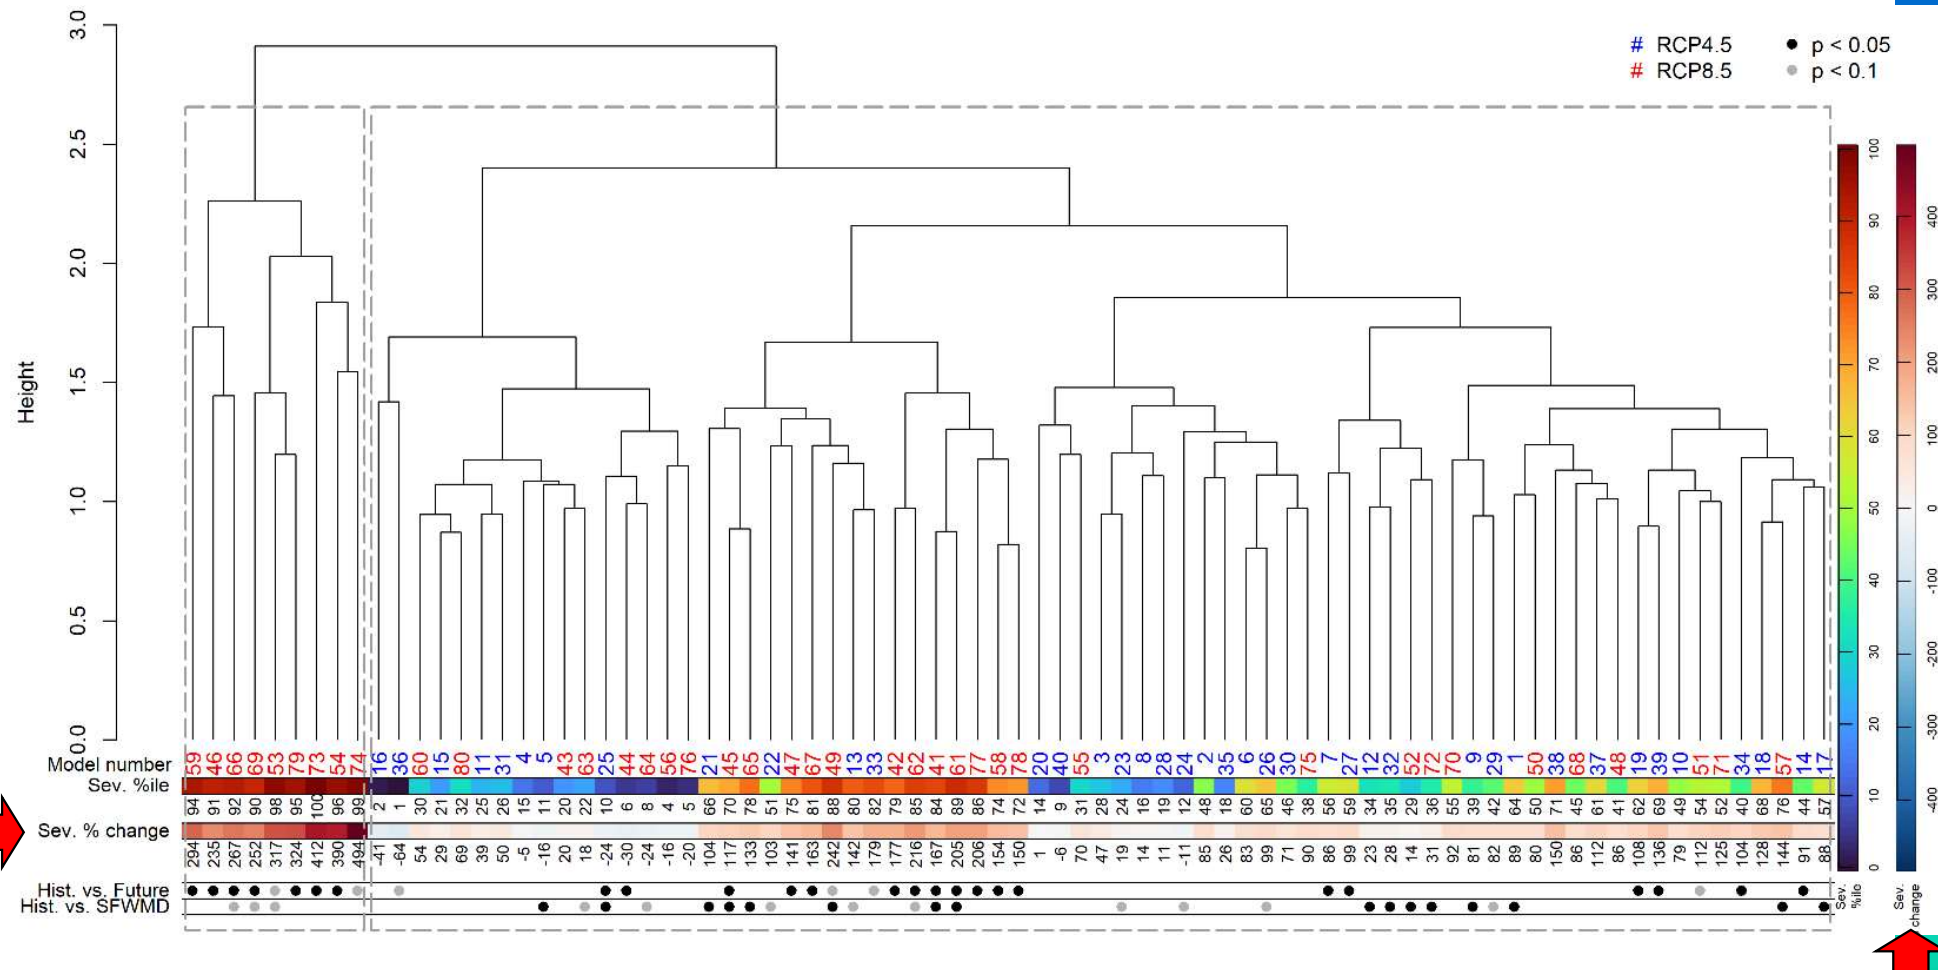

**Hierarchical  
clustering using  
Wasserstein's distance**

## Cluster dendrogram for entire SFWMD, 12-month timescale

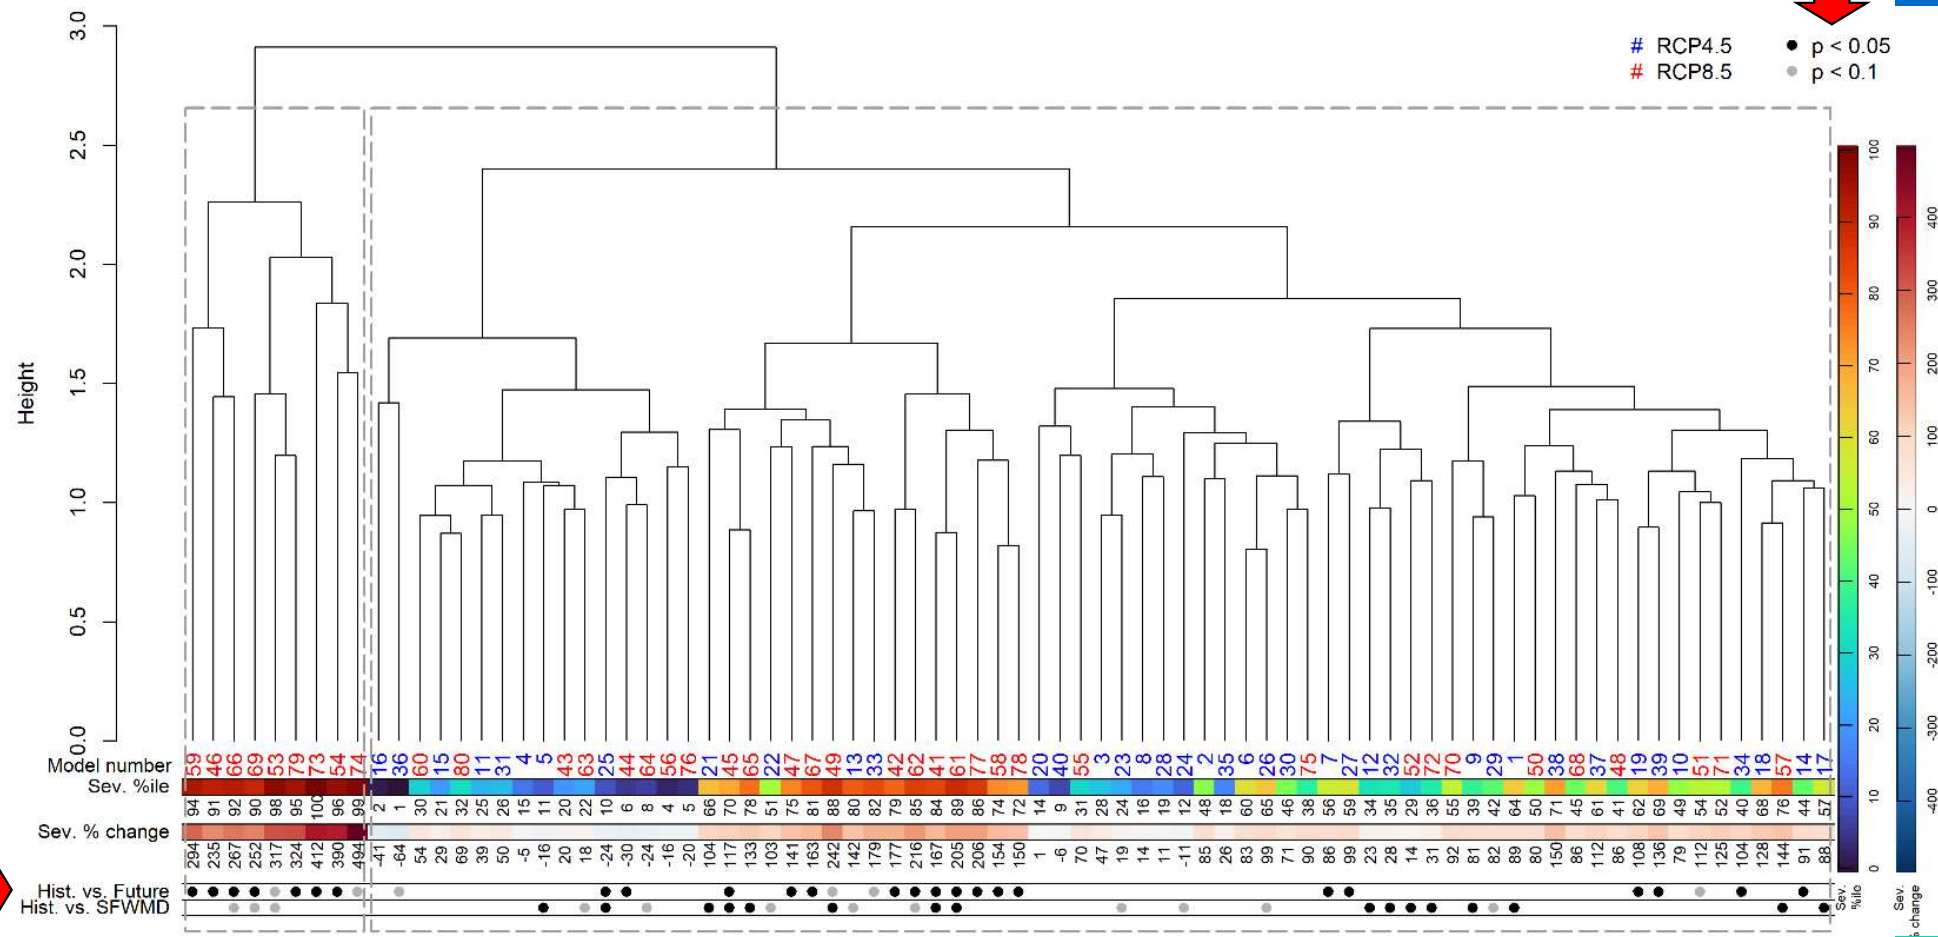

## Cluster dendrogram for entire SFWMD, 12-month timescale

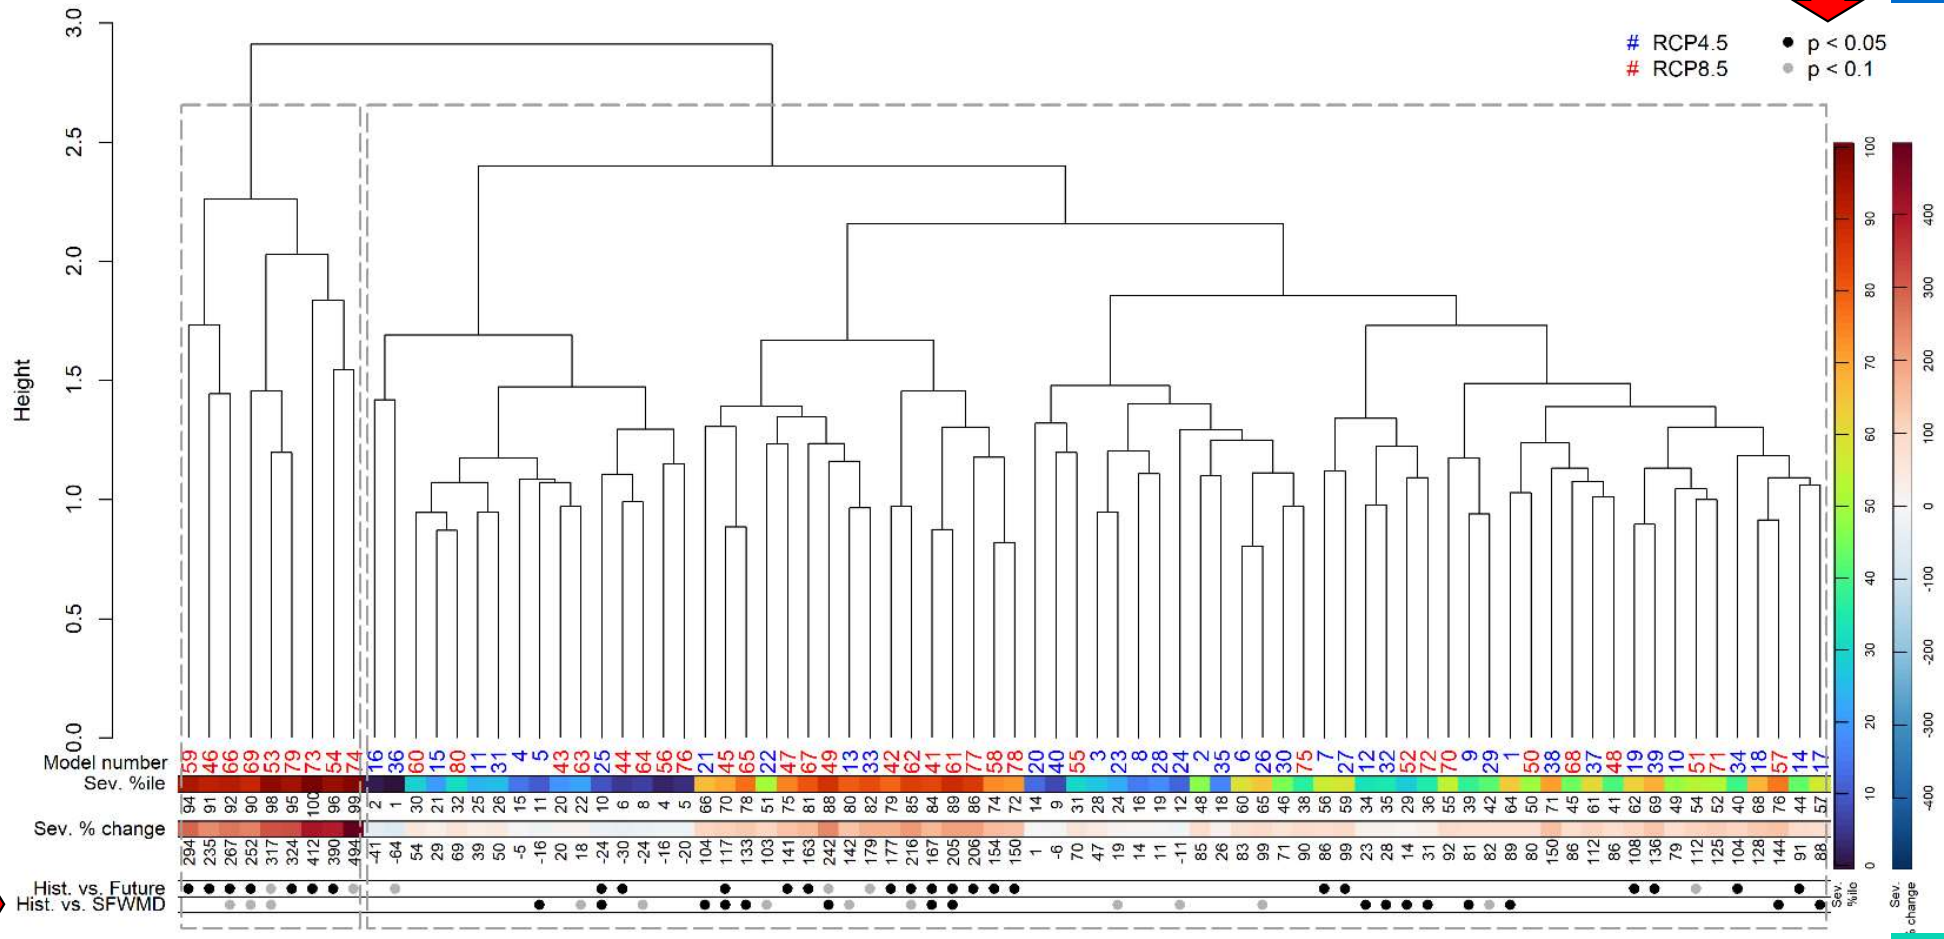

Preliminary Information-Subject to Revision. Not for Citation.

## Cluster dendrogram for entire SFWMD, 12-month timescale

Preliminary Information-Subject to Revision. Not for Citation.

## Cluster dendrogram for entire SFWMD, 12-month timescale

## Next Steps

- Working on a USGS data release with key files and results from the future drought evaluation analyses.
- Writing journal article: “Characterizing Projected Future Droughts for South Florida”
